

# Assignment 5

Math 383L Fall 2022

Due 10/11 (Before Class)

## 1 Euler's Method

- (a) Write a program to implement Euler's Method for the general initial value problem  $y' = f(t, y)$  with  $y(0) = y_0$ . It should take in the function, the initial value, the end time, and a step size  $h$ .
- (b) Try out your program with the ODE  $y' = -y^2$  with  $y_0 = 1$ . Use a step size  $h = 0.1$  and a final time  $T = 3$ . Plot the solution.
- (c) Find the exact solution using Wolfram Alpha. Plot the solution.
- (d) Now vary your step size  $h = 0.1, 0.05, 0.025, 0.01, 0.005, 0.0025, 0.001$ . Keep track of the absolute error at the final time step (use the analytic solution to find the error).
- (e) Verify that the order of the method is indeed first order. To do this, take the log of the errors and the log of the step sizes and plot them. What is the slope of the line? (same as last week)
